**ABSTRACT**

**TITLE OF INVENTION:**

**ICE-LETS**

When Ice is put into the tube (Ice-lets) and wrapped around your ankle or wrist, it will cool your body temperature down by cooling down your own blood circulation that is circulating through your body. What is new about the product/device is that there are no batteries, electrical cords or coolant that need to be used. All you need is ice, which is cheap, affordable and available. This will save you money on your electric bill so that you can keep cool without using your air conditioner. You can use it when you do your gardening on hot days or when you take long walks in the summer, go to the swap meet, in your car (if your air conditioner is not working) or anywhere that you would need to keep cool.
